summary table and query and cardir

Google Search

The **"AND"** operator is unnecessary -- we include all search terms by default.
[\[details\]](#)

"and" (and any subsequent words) was ignored because we limit queries to 10 words.

Web · [Images](#) · [Groups](#) · [Directory](#) · [News](#)

Your search - **summary table and query and cardinality and plan and overlap and estimate and statistic and "summary table" and vertical overlap** - did not match any documents.

Suggestions:

- Make sure all words are spelled correctly.
- Try different keywords.
- Try more general keywords.
- Try fewer keywords.

Also, you can try [Google Answers](#) for expert help with your search.

Priti Mishra , Margaret H. Eich

ACM Computing Surveys (CSUR) March 1992
Volume 24 Issue 1

The join operation is one of the fundamental relational database query operations. It facilitates the retrieval of information from two different relations based on a Cartesian product of the two relations. The join is one of the most difficult operations to implement efficiently, as no predefined links between relations are required to exist (as they are with network and hierarchical systems). The join is the only relational algebra operation that allows the combining of related tuples from ...
